

Data Anonymization A 'Risky' affair?

Manjusha Gode

Data Anonymization – A ‘Risky’ affair?

Agenda

- Basics
- Attacks and risks
- Process of document anonymization
 - Anonymization
 - Risk assessment
- Risk of re-identification
- Challenges
- Conclusion

Basics

- Attack – effort to re-identify an individual from data
- Context – where the data will be shared, intended use
- Risk Threshold – Acceptable value of risk
- Information loss/Data Utility
- Identifiers – Direct and Quasi

Attacks

Four types of plausible attacks:

- Deliberate
- Inadvertent
- Breach
- Demonstration

First three are typically in a restricted environment whereas fourth one is in public domain.

Why to bother?

- **Attacks can be real!**
- Legal, Financial and reputational impact

Risk Mitigation Mechanisms

- Security and controlled access
- Motive and capacity
- Contracts

Methods of Anonymization

Masking

- Suppression
- Randomization
- Pseudonymization

De-identification

- Generalization
- Sub-sampling
- Suppression

HIPAA – De-identification

HIPAA Privacy Rule De-identification Methods

Expert Determination § 164.514(b)(1)

Apply statistical or
scientific principles

Very small risk that
anticipated recipient
could identify individual

Safe Harbor § 164.514(b)(2)

Removal of 18 types of
identifiers

No actual knowledge
residual information can
identify individual

1. Names
2. Geographical references
3. Dates (Except Year)
4. Phone numbers
5. Fax numbers
6. Email addresses
7. Social Security numbers
8. Medical record numbers
9. Health plan beneficiary numbers
10. Account numbers
11. Certificate/license numbers
12. Vehicle identifiers
13. Device identifiers and serial numbers
14. Web Universal Resource Locators
15. Internet Protocol (IP) address numbers
16. Biometric identifiers, including finger and voice prints
17. Full face photographic images and any Comparable images;
18. Any other unique identifying number, characteristic

Risk Assessment Process

Risk Assessment

Confusion matrix

	Identified as PHI	Not identified as PHI	
PHI	TP	FN	→ Deals with the recall
Not PHI	FP	TN	

↓

Deals with the Precision

- Catch
- Leak
- Precision
- Recall

Risk Threshold

Risk Calculation

1. Deliberate:

$$Pr(\text{re-id, attempt}) = Pr(\text{attempt}) \times Pr(\text{re-id} \mid \text{attempt})$$

2. Inadvertent:

$$Pr(\text{re-id, acquaintance}) = Pr(\text{acquaintance}) \times Pr(\text{re-id} \mid \text{acquaintance})$$

3. Data breach:

$$Pr(\text{re-id, breach}) = Pr(\text{breach}) \times Pr(\text{re-id} \mid \text{breach})$$

4. Demonstration:

$Pr(\text{re-id})$ - based on de-identified data

Our Approach

Risk Vs Data Utility

The goal should be to maximize data utility while meeting the predefined risk thresholds

Challenges

- Context – clarity?
- Availability of information in public domain
- Ensuring exhaustiveness of :
 - Anonymization parameters
 - References of patient data within and across other sources of information
- Instance of an identifier in Graph/image – needs OCR
- Risk in un-redacted part
- Single entries – possible candidates for re-identification

Risk Report Contents

- Risk Determination Statement
- Coverage
- Anonymization process and risk model
- Risk threshold
- Transformations applied
- Risk measurement
- Risk assessment
- Data utility
- References

Summary

- Four types of attacks
- Risk Threshold
- Masking for direct identifiers and de-identification for Quasi identifiers
- Four step process (Iterative)
 - Determine context
 - Determine risk threshold
 - Anonymize
 - Assess risk
- Risk Report – documenting the process of anonymization and risk calculation and assessment
