

The 4 C's of Collaboration

Alice Perry & Jenn Fukuyama

Empower data-driven decisions and create transparency among teams

As drug development teams become increasingly global, the silos in which independent study teams operate highlight the growing need for tools that unify and streamline processes to increase data quality and consistency, improve communication, and conserve precious time and resources. Interactive technology facilitates cross-team collaboration among Biostats, Data Management, and Clinical Data Standards teams throughout the complex regulatory submission preparation process.

Coordination

Your team is BUSY. How can you maintain efficiency and keep track of who is doing what?

- Review & understand the Issues at hand and how they are impacting submission readiness
- Assign access to colleagues across Biostats, Data Management, and Clinical Data Standards teams
- Bulk update "like" Issues with Status, Assignee, Sources, Comments and/or Explanations
- Inform and prioritize Issue fixes by urgency using Recommended Tasks

Communication

Streamlined communication makes a huge difference for global, asynchronous organizations.

- Use in-app Comments and tagging for efficient Issue triage without relying on outside messaging platforms
- Add or change Source, Status & Impact on the spot, as you work
- Ensure all information and correspondence lives in one place to avoid version confusion

Cooperation

Divide and conquer. Cross-team collaboration is essential when working toward a deadline.

- Assign Issues to colleagues or teams that are best suited to fix them
- Biostats, Data Management, and Clinical Data Standards teams work together on timelines for resolution
- Suggest and vote for new Fix Tips for Rules that always seem to frustrate your team

Clarity

Consistent Explanations reduce discrepancies that cause costly delays among teams and improve submission quality and timelines.

- Leverage custom Issue Metadata to standardize Issue Explanations and messaging across your portfolio
- Understand how specific issues impact Data Fitness and Projected Scores
- Monitor which (and how many) Data Packages an Issue impacts to improve work across studies
