

Harnessing the power of JSON and SAS

PHUSE SDE, Tarrytown, NY

Pritesh Desai, SAS Institute Inc.
Samiul Haque, SAS Institute Inc.

Agenda

- State of the industry and FDA
- Introduction to JSON
- How SAS handles JSON
- SAS Support for dataset-JSON and beyond
- Q&A

State of the industry

Technical Limitation of previous transport format

- Limited variable type
- No multibyte characters
- Restricted variable width and format
- Storage limitations
- Structural limitations
- Larger file sizes (Dataset-XML)
- Metadata is separate (Dataset-XML)

Timeline

Introduction to JSON

As per https://www.w3schools.com/js/js_json_intro.asp

- JSON stands for JavaScript Object Notation
- It is a lightweight data-interchange format
- It is plain text written in JavaScript object notation
- It is used to send data between computers
- It is language independent

As per [Working with Dataset-JSON using SAS ©](#)

- JSON value can be an *object*, *array*, *number*, *string*, *true*, *false* or *null*.

- Example:

```
{  
  "clinicalData": {  
    "studyOID": " cdisc.com/CDISCPILLOT01",  
    "metaDataVersionOID": "MDV.MSGv2.0.SDTMIG.3.3.SDTM.1.7",  
    "itemGroupData": {  
      "IG.DM": { ... },  
      ... }  
    }  
  }  
}
```

Why JSON ?

JSON stands for JavaScript Object Notation. JSON is a lightweight format for storing and transporting data.

Interoperability

- Files are compact
- Easier to read for humans

Dataset Size

- Files are smaller
- Makes data transfer faster

Unicode

- Language-independent
- Parsers available for most programming languages

String Limit

- No inherent limit
- Default max is 2097152 characters

Column Limit

- Max allowed packet bytes
- Default is 104,857,600 bytes

Metadata

- Describes data, metadata and location
- File generation and data producer

JSON in SAS

Read JSON

- LIBNAME JSON

```
filename mydata "/path/my-json-file.json";  
libname myjson JSON fileref=mydata;  
  
proc datasets lib=myjson; quit;
```

Write JSON

- PROC JSON

```
proc json out="path-to-DefaultOutput.json" pretty;  
    export sashelp.class (where=(age=11));  
run;
```

How SAS Handles JSON – Libname Engine

As per SAS community post on [How to read JSON data in SAS](#) Chris Hemedinger has some good notes as following for JSON libname engine

Notes:

- The JSON libname engine is a read-only engine. [To convert SAS data to JSON, use PROC JSON.](#)
 - The JSON engine can read data only from a fileref, not from literal string values or from variables in a table. If you have JSON data from another source (such as a field in a database), you must first write the content to a file so the JSON engine can process it.
 - The JSON engine requires complete, valid JSON in order to map the data into SAS. JSON snippets, or variations such as JSONL (multiple JSON objects in a single file, one per line), require preprocessing to build valid JSON before the engine can read them.
 - JSON is almost always UTF-8 encoded text (so it supports national characters and even [extended characters such as emojis](#)).
- Therefore, you'll have the best success when using SAS with Unicode support, or ENCODING=UTF8 enabled. This is the default in SAS Viya

```
filename mydata "/path/my-json-file.json";  
libname myjson JSON fileref=mydata;  
  
proc datasets lib=myjson; quit;
```

How SAS Handles JSON-Procedure

As per [SAS Documentation](#)

What Does the JSON Procedure Do?

The JSON procedure reads data from a SAS data set and writes it to an external file in JSON representation. You can control the exported data with several options that remove content and affect the format. In addition to exporting data from a SAS data set, PROC JSON provides statements that enable you to write additional data to the external file and control JSON containers. SAS provides the JSON engine to read a JSON file. For more information, see [LIBNAME Statement: JSON Engine](#) in SAS Global Statements: Reference.

```
proc json out="path-to-DefaultOutput.json" pretty;  
    export sashelp.class (where=(age=11));  
run;
```

RAW JSON FILE

```

```

JSON engine reads JSON data and convert
It into sets of related tables

```
%let fileloc ='/nfsshare/dataset_json/json_sas/json/sdtm/ae.json';
libname ae JSON &fileloc;
```

AE	
▶	ALLDATA
▶	CLINICALDATA
▶	IG_AE_ITEMDATA
▶	IG_AE_ITEMS
▶	ITEMGROUPDATA_IG_AE
▶	ROOT

```
proc sql noprint;  
select name into :Col_name separated by ' '  
from AE.IG_AE_ITEMS  
order by ordinal_items;  
quit;  
%put &Col_name;
```

```
proc sql noprint;  
select count(*) into:Num_elements from AE.IG_AE_ITEMS;  
quit;  
  
%put &Num_elements;
```

```
%macro doit;  
  data AE;  
    set AE.ig_ae_itemdata;  
    %do i = 1 %to Num_elements;  
      rename element&i.= %scan(&Col_name.,&i.);  
    %end;  
  run;  
%mend doit;
```

At this point it becomes a simple programming Exercise to get the AE table in desired format

The screenshot shows a SAS table viewer for the 'AE' table. The table has 18 rows and 7 columns. The columns are: STUDYID, DO..., USUBJID, AESEQ, AELN..., and AETERM. The rows contain data for various adverse events, including INJECTION SITE REACTION, FATIGUE, JOINT DISLOCATION, INCONTINENCE, SKIN LACERATION, CONFUSIONAL STATE, DYSPNOEA, SUDDEN DEATH, HYPERHIDROSIS, STOMACH DISCOMFORT, PAIN, NASAL CONGESTION, MALAISE, MYALGIA, and PHARYNGOLARYNGEAL PAIN.

	STUDYID	DO...	USUBJID	AESEQ	AELN...	AETERM
1	CDISCPLOT01	AE	CDISC001	1	1	INJECTION SITE REACTION
2	CDISCPLOT01	AE	CDISC001	2	2	FATIGUE
3	CDISCPLOT01	AE	CDISC002	1	1	INJECTION SITE REACTION
4	CDISCPLOT01	AE	CDISC002	2	2	SHOULDER PAIN
5	CDISCPLOT01	AE	CDISC002	3	3	JOINT DISLOCATION
6	CDISCPLOT01	AE	CDISC002	4	4	INCONTINENCE
7	CDISCPLOT01	AE	CDISC002	5	5	INJECTION SITE REACTION
8	CDISCPLOT01	AE	CDISC002	6	6	SKIN LACERATION
9	CDISCPLOT01	AE	CDISC002	7	7	CONFUSIONAL STATE
10	CDISCPLOT01	AE	CDISC002	8	8	DYSPNOEA
11	CDISCPLOT01	AE	CDISC002	9	9	SUDDEN DEATH
12	CDISCPLOT01	AE	CDISC003	1	1	HYPERHIDROSIS
13	CDISCPLOT01	AE	CDISC003	2	2	STOMACH DISCOMFORT
14	CDISCPLOT01	AE	CDISC003	3	3	PAIN
15	CDISCPLOT01	AE	CDISC003	4	4	NASAL CONGESTION
16	CDISCPLOT01	AE	CDISC003	5	5	MALAISE
17	CDISCPLOT01	AE	CDISC003	6	6	MYALGIA
18	CDISCPLOT01	AE	CDISC003	7	7	PHARYNGOLARYNGEAL PAIN

SAS, JSON, and Opensource

- JSON has been extensively used by web developer community
- Resources available in Python
- SAS can execute Python (and R) through PROC Python
- SAS Platform supports SAS, Python, and R

```
proc python;  
submit ;  
  
import pandas as pd  
import json  
  
#your python code here  
  
# Closing file  
  
endsubmit;  
run;
```

SAS support for JSON and beyond

As per 2022 PharmaSUG paper [Working with Dataset-JSON using SAS®](#) , Lex Jansen from CDISC added a nice conclusion.

CONCLUSION

SAS fully supports reading and writing Dataset-JSON files in an efficient way.

VALIDATION

When reading or writing JSON files, it is important to validate the process. The published JSON specification also comes with a JSON schema that can be used to validate JSON files [15].

With a simple Python program, the JSON file can be validated against the schema (Appendix 2).

Also, the read/write process can be validated by doing a roundtrip and comparing SAS datasets or JSON-files:

- Dataset-JSON → SAS dataset → Dataset-JSON
- SAS dataset → Dataset-JSON → SAS dataset

SAS datasets can be compared with PROC COMPARE. It can be expected that there will differences for numeric floating-point variables in the order of machine precision.

Thank You!
